

This report summarizes the pricing trends, market activity, and competitive landscape of the San Gabriel residential housing market from January 2024 through December 2025, the latest month available for this particular market. All analyses focus exclusively on single-family residential properties.

Market Overview

Median close prices ranged from \$0.96 million to \$1.45 million during the report period, declining overall from March 2024 to March 2025 before rebounding in July 2025.

Single-family residences sold within an average of 14 to 41 days, reflecting relatively healthy demand. However, average days on market fluctuated considerably, with periodic spikes every four to five months followed by rapid declines.

Pricing Trends

The single-family housing market was relatively competitive, with the average sale-to-list ratio above 1 in most months and peaking at 1.05 in March 2024. Buyer leverage appeared to strengthen in September and October, when the average ratio dipped slightly below 1 in both 2024 and 2025.

Average price per square foot ranged from \$695 to \$858, with monthly fluctuations of \$6 to \$159. It remained relatively stable in the first half of 2025 but otherwise showed notable variability.

Market Activity

Market supply of single-family residences showed several peaks over the past two years, reaching 13 to 16 new listings in July 2024, August 2024, March 2025, and May 2025. In most other months, the number of new listings remained between 5 and 10.

Sales were generally below supply. While March 2024, April 2024, and October 2025 recorded relatively higher sales activity, most months saw fewer than 5 closed transactions, with particularly low levels from June 2024 through June 2025.

Sales volume followed a similar pattern, peaking in those same three months at around \$15 million or more. In other months, it remained relatively stable, typically ranging between \$1 million and \$5 million.

Competitive Landscape

Five listing agents achieved over \$4 million in sales volume over the past two years, led by Danny Hy at \$6.45 million. Other agents in the top 100 list recorded at least \$1 million in sales volume.

High sales volume did not necessarily correspond to a high number of units sold. While Danny Hy and Anne Kislingbury ranked among the top two in both sales volume and sales units, others achieved high volume through fewer transactions—for example, Ly Hua generated \$4.2 million from a single transaction.

Among brokerages, Coldwell Banker Realty and Pinnacle Real Estate Group led in both sales volume and sales units. Other firms trailed far behind—Keller Williams Realty, ranked third on both measures, recorded about \$8 million less in sales volume and seven fewer transactions than the firm ahead. Most other brokerages in the top 100 achieved \$1-2 million in sales volume with fewer than four transactions.

Key Takeaways

From January 2024 to December 2025, San Gabriel's single-family housing market showed seasonal slowdowns but generally healthy demand. The sales-to-list ratio remained above 1 in most months, while close prices and price per square foot fluctuated moderately. Overall market activity was stable, with new listings consistently exceeding closed sales.

Performance differences were modest at the agent level. In contrast, brokerage-level variation was more pronounced, with Coldwell Banker Realty and Pinnacle Real Estate Group significantly outperforming other firms in both sales volume and sales units.
